

Data Science AI Integration: From Brief to Production

Set up before the event

There is no setup time in the session; the first task begins a few minutes in. Arrive with everything below already working.

ACCOUNTS

- A Google account with Gemini and Gems (gemini.google.com), plus Colab with Gemini enabled (colab.research.google.com).
- A Claude account (Pro or Team) with Claude Code in VS Code.
- No Claude subscription? The open-source Gemini CLI is free with a personal Google account: `npm install -g @google/gemini-cli`, then run `gemini` in the project folder. The agentic milestone works with any agentic coding tool.

SOFTWARE

- VS Code with a terminal, and Git.
- Python 3.10 or newer with pandas, seaborn, scikit-learn, and shap:
`pip install pandas seaborn scikit-learn shap`

WORKSHOP FILES

- Download `workshop_files.zip` from the workshop site and unzip it into a working folder you can open in VS Code.
- Contents: `dukalink_customers.csv`, `dukalink_orders.csv`, `colab_starter.ipynb`, `baseline_model.ipynb`, `flawed_snippet.py`, `slow_pipeline.py`, and the prompts folder (`eda_prompt.txt`, `etl_spec_prompt.txt`).

QUICK SELF-TEST (five minutes, the night before)

1. Open gemini.google.com and confirm you can create a Gem.
2. Open a Colab notebook and confirm Gemini is available in it.
3. In VS Code, open the unzipped folder and start your agentic CLI (Claude Code, or `gemini`) without errors.
4. Run: `python -c "import pandas, seaborn, sklearn, shap"`

See you at the sprint. Asante sana!
